About the SDK SDK Functions Listing Appendix A: What's New

About the Vicon DataStream Software Development Kit (SDK)

The Vicon DataStream Software Development Kit (SDK) allows easy programmable access to the information contained in the Vicon DataStream. The function calls within the SDK allow users to connect to and request data from the Vicon DataStream. The following combinations of platforms and technologies are supported:

	Windows x86 (32-bit)	Windows x64 (64- bit)	Linux x86 (32- bit)	Linux x64 (64-bit)	Mac OSX (64&32-bit)
C++	✓	✓	✓	√	✓
.NET	✓	✓			
MATLAB	✓ (can be run on Windows 64-bit OS)	✓ (requires Microsoft Professional compiler)			

Important Notes:

- Not all function calls contained within the SDK will return data when connected to certain Vicon Applications. For example, Vicon Blade does not support analog devices, and therefore will not output device information into the DataStream.
- The current DataStream format is supported by Vicon Nexus 1.4+, Vicon Blade 1.6+, and Tracker 1.0+. These applications may also output an additional stream in the legacy Tarsus format. This DataStream SDK only accesses the DataStream format.
- The current intention is that all future Vicon applications will support the DataStream format.
- Example files are supplied as *unsupported* examples only.
- The SDK only supports axis transformations into right handed co-ordinate systems.
- The SDK is designed to allow multiple instances of a Client within a single process which can connect to multiple DataStreams.

The SDK is supplied as shared libraries – DLLs on Windows, SOs on Linux, and DYLIBs on MacOS. The shared libraries and supporting files are required to be copied alongside your client executable.

About the SDK SDK Functions Listing Appendix A: What's New

Installing on Windows

There are separate installers for the 32-bit and 64-bit SDKs. The 64-bit installer will only work on a 64-bit version of Windows. The default install directories are:

64-bit Windows

32-bit SDK : C:\Program Files (x86)\Vicon\DataStream SDK\Win32

■ 64-bit SDK : C:\Program Files\Vicon\DataStream SDK\Win64

32-bit Windows

32-bit SDK : C:\Program Files\Vicon\DataStream SDK\Win32

Installing on Linux

The SDK is provided as a compressed archive. Extract the archive into a convenient location on your system.

Installing on Mac OSX

The dylibs should be placed in /usr/lib and marked as executable:

```
sudo cp libViconDataStreamSDK_CPP.dylib /usr/lib
sudo cp libDebugServices.dylib /usr/lib
sudo chmod 755 /usr/lib/libViconDataStreamSDK_CPP.dylib
sudo chmod 755 /usr/lib/ libDebugServices.dylib
```

SDK Functions Listing

Appendix A: What's New

Application Linking and Redistribution

Windows - C++

Your application should

- #include "Client.h"
- Link against "ViconDataStreamSDK_CPP.lib"
- Redistribute:
 - "ViconDataStreamSDK CPP.dll"
 - "Microsoft.VC8.CRT" (x86) or "Microsoft.VC9.CRT" (x64).

Windows - .NET

Your application should

- Link against the assembly "ViconDataStreamSDK_DotNET.dll".
- Redistribute:
 - "ViconDataStreamSDK_DotNET.dll"
 - "ViconDataStreamSDK_CPP.dll"
 - "Microsoft.VC8.CRT" (x86) or "Microsoft.VC9.CRT" (x64).
- Have the .NET Framework 2.0 or later installed.

The managed code in this assembly requires the unmanaged code in the C++ SDK

Windows - MATLAB

Your application M file should be in the same directory as

- "Client.m"
- "DeviceType.m"
- "Direction.m"
- "Result.m"
- "StreamMode.m"
- "TimecodeStandard.m"
- "Unit.m"
- "ViconDataStreamSDK_MATLAB.dll"
- "ViconDataStreamSDK_MATLAB.h"
- "Microsoft.VC8o.CRT"

Linux - C++

Your application should

- #include "Client.h"
- Link against libViconDataStreamSDK_CPP.so and libDebugServices.so
- Redistribute libViconDataStreamSDK_CPP.so and libDebugServices.so
- To compile ViconDataStreamSDK_CPPTest.cpp test application:
 - Execute "g++ ViconDataStreamSDK_CPPTest.cpp -L. -IViconDataStreamSDK_CPP IDebugServices"

About the SDK SDK Functions Listing Appendix A: What's New

- (-L. assumes the libraries LibViconDataStreamSDK_CPP.so and libDebugServices.so are in the current directory)
- To run ViconDataStreamSDK_CPPTest test application:
 - Set LD_LIBRARY_PATH to location of LibViconDataStreamSDK_CPP.so and libDebugServices.so:
 - (on bash shell) export LD_LIBRARY_PATH=.
 - o Execute ViconDataStreamSDK_CPPTest
- N.B. To build and run with LibViconDataStreamSDK_CPP.so and libDebugServices.so in a different directory (e.g./foo/bar), change –L.in compile line to –L/foo/bar, and set LD_LIBRARY_PATH to /foo/bar

Mac OSX - C++

Requirements are

■ Intel 64 or 32 bit

Your application should

- #include "Client.h"
- Link against "libViconDataStreamSDK_CPP.dylib" and "libDebugServices.dylib"
- Redistribute "libViconDataStreamSDK_CPP.dylib" and "libDebugServices.dylib"
- To compile ViconDataStreamSDK_CPPTest.cpp test application:
 - Execute "g++ ViconDataStreamSDK_CPPTest.cpp -L. -IViconDataStreamSDK_CPP IDebugServices"
 - (-L. assumes the libraries libViconDataStreamSDK_CPP.dylib and libDebugServices.dylib are in the current directory)
- To run ViconDataStreamSDK_CPPTest test application:
 - Set DYLD_LIBRARY_PATH to location of libViconDataStreamSDK_CPP.dylib and libDebugServices.dylib:
 - (on bash shell) export DYLD LIBRARY PATH =.
 - o Execute ViconDataStreamSDK_CPPTest
- N.B. To build and run with libViconDataStreamSDK_CPP.dylib and libDebugServices.dylib in a different directory (e.g./foo/bar), change –L.in compile line to –L/foo/bar, and set DYLD_LIBRARY_PATH to /foo/bar

The SDK was compiled with gcc version 4.2.1 (Apple Inc. Build 5646) using flags:

-mmacosx-version-min=10.4 -isysroot /Developer/SDKs/MacOSX10.6.sdk -arch i386 -arch x86 64 -O2

About the SDK SDK Functions Listing Appendix A: What's New

What's New in Version 1.4.0

- New function calls:
 - SetApexDeviceFeedback.

Requirements

- A compatible licensed version of Vicon Blade, Vicon Nexus, or Vicon Tracker must be present.
- LabVIEW will make use of the .NET dll, and has been found to function in versions 7.1 and 8.

The MATLAB dll has been found to function in versions 7 and 8.

The SDK has not been designed to allow access from Simulink.

The Linux SDK has been specifically verified on CentOS 5.5, Ubuntu 8.04, Ubuntu 9.04, Fedora 9, and Fedora 11. It should also work on any platform supporting glibc 2.5 or later.

SDK Functions Listing

Appendix A: What's New

Function Result Return Values

Every function returns a data structure containing elements specified in the "Output" section of each method reference. Most functions return a "Result" item, which indicates the success or cause of failure for the function and useful for debugging purposes.

When a function has returned false, the output arguments are set to an appropriate default value:

- Booleans will be set to false.
- Integers will be set to zero.
- Doubles will be set to zero.
- Strings will be set to zero length.

When the output argument is an array, all elements are set in this manner.

Conventions

By default the global coordinate system matches the server application; Z-Up, Y-Left. This can be changed by using Client::SetAxisMapping.

Units

Positions are expressed in millimeters. Rotation is expressed in radians.

Vectors and Matrices

Positions are passed as 3 elements corresponding to (x,y,z).

A 3 matrix is passed row-wise as a vector of 9 elements:

$$\begin{bmatrix} x_0 & x_1 & x_2 \\ x_3 & x_4 & x_5 \\ x_6 & x_7 & x_8 \end{bmatrix}$$

Matrices are assumed to pre-multiply:

$$ABC = A(BC)$$

Euler Angles

When used an XYZ Euler angle (x,y,z) is constructed:

$$R_x R_y R_z$$

$$R_{\chi}(R_{\nu} R_{z})$$

$$\begin{vmatrix} 1 & 0 & 0 \\ 0 & \cos x & -\sin x \\ 0 & \cos x & \sin x \end{vmatrix} \begin{vmatrix} \cos y & 0 & \sin y \\ 0 & 1 & 0 \\ -\sin y & 0 & \cos y \end{vmatrix} \begin{vmatrix} \cos z & -\sin z & 0 \\ \sin z & \cos z & 0 \\ 0 & 0 & 1 \end{vmatrix}$$

```
\cos y \cos z -\cos y \sin z \sin y

\cos x \sin z + \sin x \sin y \cos z \cos x \cos z - \sin x \sin y \sin z -\sin x \cos y

\sin x \sin z - \cos x \sin y \cos z \sin x \cos z + \cos x \sin y \sin z \cos x \cos y
```

SDK Functions Listing: Construction and Destruction

Appendix A: What's New

List of all SDK Functions

Construction and Destruction

```
You can create many instances of the Vicon DataStream Client which can connect to multiple Vicon DataStream Servers.
C++
               C++ is object oriented, so use the class constructor.
                 ViconDataStreamSDK::CPP::Client StackClient;
                 Output SomeFunction Output = StackClient.SomeFunction();
               } // Client is implicitly destroyed as it goes out of scope
               ViconDataStreamSDK::CPP::Client * pHeapClient =
                                      new ViconDataStreamSDK::CPP::Client();
               Output_SomeFunction Output = pHeapClient->SomeFunction(Input); delete pHeapClient;
MATLAB
               The MATLAB SDK is object oriented, and needs to be explicitly loaded and unloaded.
               Client.LoadViconDataStreamSDK();
               pHeapClient = Client();
               Output = pHeapClient.SomeFunction( Input );
               Client.UnloadViconDataStreamSDK();
.NET
               .NET is object oriented, so use the class constructor. Because objects are lazily garbage
               collected, your instance may outlive the last reference to it for some time. If the instance is
               pre-fetching frame data for you, then it can still use CPU and network bandwidth. Consider
               explicitly disconnecting prior to destruction.
               ViconDataStreamSDK.DotNET.Client pHeapClient =
                                        new ViconDataStreamSDK.DotNET.Client();
               Output SomeFunction Output = pHeapClient.SomeFunction(InputParam);
               // Signal to the garbage collector that it can clean up
               pHeapClient.Disconnect();
               pHeapClient = null;
```

About the SDK SDK Functions Listing: Result Appendix A: What's New

Result

he Result code indicates the success or failure of a function.					
	Unknown	The result is unknown. Treat it as a failure.			
	NotImplemented	The function called has not been implemented in this version of the SDK.			
	Success	The function call succeeded.			
	InvalidHostName	The "HostName" parameter passed to Connect() is invalid.			
	InvalidMulticastIP	The "MulticastIP" parameter was not in the range "224.0.0.0" – "239.255.255.255"			
	ClientAlreadyConnected	Connect() was called whilst already connected to a DataStream.			
	ClientConnectionFailed	Connect() could not establish a connection to the DataStream server.			
	ServerAlreadyTransmittingMultcast	StartTransmittingMulticast() was called when the current DataStream server was already transmitting multicast on behalf of this client.			
	ServerNotTransmittingMulticast	StopTransmittingMulticast() was called when the current DataStream server was not transmitting multicasr on behalf of this client.			
	NotConnected	You have called a function which requires a connection to the DataStream server, but do not have a connection.			
	NoFrame	You have called a function which requires a frame to be fetched from the DataStream server, but do not have a frame.			
	InvalidIndex	An index you have passed to a function is out of range.			
	InvalidSubjectName	The Subject Name you passed to a function is invalid in this frame.			
	InvalidSegmentName	The Segment Name you passed to a function is invalid in this frame.			
	InvalidMarkerName	The Marker Name you passed to a function is invalid in this frame.			
	InvalidDeviceName	The Device Name you passed to a function is invalid in this frame.			
	InvalidDeviceOutputName	The Device Output Name you passed to a function is invalid in this frame.			

About the SDK SDK Functions Listing: Result Appendix A: What's New

```
InvalidLatencySampleName
                                                    The Latency Sample Name you passed to a
                                                    function is invalid in this frame.
          CoLinearAxes
                                                    The directions passed to SetAxisMapping()
                                                    contain input which would cause two or more axis
                                                    to lie along the same line, e.g. "Up" and "Down"
                                                    are on the same line.
          LeftHandedAxes
                                                    The directions passed to SetAxisMapping() would
                                                    result in a left handed co-ordinate system. This is
                                                    not supported in the SDK.

SDK Functions Listing: Connect

Appendix A: What's New

Connect

Establish a dea	Establish a dedicated connection to a Vicon DataStream Server			
See also: Conn	nectToMulticast, Disc	onnect, IsConn	nected	
Input	Host Name	string	The DNS identifiable name, or IP address of the PC hosting the DataStream server. The function defaults to connecting on port 801. You can specify an alternate port number after a colon.	
			"localhost" "MyViconPC:804" "10.0.0.2"	
Output	Result	Result	Result.Success Result.InvalidHostName Result.ClientAlreadyConnected Result.ClientConnectionFailed	
C++	// { // public: // Result:: // }; // Output_Con	<pre>// public: // Result::Enum Result; // };</pre>		
	<pre>ViconDataStreamSDK::CPP::Client MyClient; Output_Connect Output = MyClient.Connect("localhost:801");</pre>			
MATLAB	% [Output] =	Connect()		
		<pre>MyClient = Client(); Output = MyClient.Connect('locahost:801');</pre>		
.NET	// { // public F // }; //	<pre>// public Result; // };</pre>		
	<pre>ViconDataStreamSDK.DotNET.Client MyClient =</pre>			

SDK Functions Listing: ConnectToMulticast

Appendix A: What's New

${\sf ConnectToMulticast}$

Connect to a Vicon DataStream Server's Multicast stream. The stream content is managed by a client who calls StartTransmittingMulticast().

See also: Con	nect, Disconnect, IsConnec	ted, StartTra	ansmittingMulticast, StopTransmittingMulticast	
Input	LocalIP	string	The DNS identifiable name, or IP address of the local Ethernet interface on which you wish to receive multicast data. You should not specify a port (any port specified will be ignored). e.g. "localhost" "10.0.0.2"	
	Multicast IP	string	The IP Address of the Multicast group on which data will be received. The address should be in the range "224.0.0.0" – "239.255.255.255" You may also specify a port by appending it to the end of the IP Address after a colon. e.g. 224.0.0.0:30001. If you do not specify a port it will default to 44801.	
Output	Result	Result	Result.Success Result.InvalidHostName Result.InvalidMulticastIP Result.ClientAlreadyConnected Result.ClientConnectionFailed	
C++	// ViconDataStreamSI Output ConnectTol	n Result; TOMultica: cicast (cc cc OK::CPP::C	st onst String & LocalIP, onst String & MulticastIP); lient MyClient;	
MATLAB	MyClient = Client	<pre>% [Output] = ConnectToMulticast() MyClient = Client(); Output = MyClient.ConnectToMulticast('locahost', '224.0.0.0');</pre>		
.NET	<pre>// { // public Result // }; // Output_Connect // ViconDataStreamSI Output_ConnectTol</pre>	<pre>// class Output_ConnectToMulticast // { // public Result Result; // }; // Output_ConnectToMulticast ConnectToMulticast (string LocalIP,</pre>

```

SDK Functions Listing: StartTransmittingMulticast

Appendix A: What's New

${\sf StartTransmittingMulticast}$

Ask the DataStream Server to start transmitting the data you are receiving directly to a Multicast address as well. This allows multiple clients to connect to your stream (via ConnectToMulticast()) whilst minimizing network bandwidth use and frame delivery latency.

See also: Connect, ConnectToMulticast, Disconnect, StopTransmittingMulticast

Input	ServerIP	string	The IP Address of the server Ethernet interface from which the Multicast data will be sent. You should not specify a port number (any port number specified will be ignored)
	MulticastIP	string	The IP Address of the Multicast group to which multicast data will be sent. The address should be in the range "224.0.0.0" – "239.255.255.255" You may also specify the port the data will be sent to by appending it to the IP Address after a colon e.g. 224.0.0.0:30001. If you do not specify a port it will default to 44801.

              Output IsDeviceDataEnabled Output = MyClient.IsDeviceDataEnabled();
                                                     // Output.Enabled == true
```

SDK Functions Listing: SetStreamMode

Appendix A: What's New

SetStreamMode

There are three modes that the SDK can operate in. Each mode has a different impact on the Client, Server, and network resources used.

- In "ServerPush" mode, the Server pushes every new frame of data over the network to the Client. The Server will try not to drop any frames. This results in the lowest latency we can achieve. If the Client is unable to read data at the rate it is being sent, then it is buffered, firstly in the Client, then on the TCP/IP connection, and then at the Server. Once all buffers have filled up then frames may be dropped at the Server and the performance of the Server may be affected.
- In "ClientPull" mode, the Client waits for a call to GetFrame(), and then request the latest frame of data from the Server. This increases latency, because we need to send a request over the network to the Server, the Server has to prepare the frame of data for the Client, and then we need to send the data back over the network. Network bandwidth is kept to a minimum, because the Server only sends what you need. We are very unlikely to fill up our buffers, and Server performance is unlikely to be affected. The GetFrame() method blocks the calling thread until the frame has been received.
- "ClientPullPreFetch" is an enhancement to "ClientPull" mode. A thread in the SDK continuously and preemptively does a "ClientPull" on your behalf, storing the latest requested frame in memory. When you next call GetFrame(), the SDK returns the last requested frame which we had cached in memory. GetFrame() does not need to block the calling thread. As with normal "ClientPull", buffers are unlikely to fill up, Server performance is unlikely to be affected. Latency is slightly reduced, but network traffic may increase if we request frames on behalf of the Client which are never used.

The stream defaults to "ClientPull" mode as this is considered the safest option. If performance is a problem, then try "ClientPullPreFetch" followed by "ServerPush".

SDK Functions Listing: SetStreamMode

Appendix A: What's New

SDK Functions Listing: SetApexDeviceFeedback

Appendix A: What's New

${\sf SetApexDeviceFeedback}$

Turn haptic feeback on or off for requested Apex device.

When you turn the Apex device feedback on, the buzzer will vibrate until it is turned off. If there are multiple clients that have different settings for whether an Apex device feedback is on or off, the Apex feedback will be on as long as it is turned on in at least one of the clients.

Input	DoviceName	A next device name		
Input	DeviceName	Apex device name		
	On	Boolean activates the haptic feedback.		
Output	Result	Result		
		Result.Success Result.NotConnected Result.NoFrame Result.InvalidDeviceName Result.HapticAlreadySet

SDK Functions Listing: SetAxisMapping

Appendix A: What's New

SetAxisMapping

Remaps the 3D axis.

Vicon Data uses a right handed co-ordinate system, with +X forward, +Y left, and +Z up. Other systems use different co-ordinate systems. The SDK can transform its data into any valid right-handed co-ordinate system by re-mapping each axis.

Specify the direction of your X, Y, and Z axis relative to yourself as the observer. Valid directions are "Up", "Down", "Left", "Right", "Forward", and "Backward". Note that "Forward" means moving away from you, and "Backward" is moving towards you.

Common usages are

- Z-up : SetAxisMapping(Forward, Left, Up)
- Y-up: SetAxisMapping(Forward, Up, Right)

             MyClient.Connect( "localhost" );
              MyClient.GetFrame();
              Output = MyClient.GetFrameNumber(); // Output.Result == Success
                                                  // Output.FrameNumber >= 1
```

SDK Functions Listing: GetLatencyTotal

Appendix A: What's New

GetLatencyTotal

Return the total latency in seconds introduced at various stages of the real-time pipeline. If no latency information is available then all latencies will be reported as o.o.

See also: GetFrame, GetTimecode, GetLatencySampleCount, GetLatencySampleName, GetLatencySampleValue

Input				
Output	Result	Result	Result.Success Result.NotConnected Result.NoFrame	
	Total	double	The total latency in seconds made from summing the other latencies.	
C++	<pre>// class Output_GetLatencyTotal // { // public: // Result::Enum Result; // double Total; // }; // // Output_GetLatencyTotal GetLatencyTotal() const; ViconDataStreamSDK::CPP::Client MyClient; MyClient.Connect("localhost"); MyClient.GetFrame(); Output GetLatencyTotal Output = MyClient.GetLatencyTotal();</pre>			
MATLAB	MyClient = Cl MyClient.Conn MyClient.GetF	<pre>% [Output] = GetLatencyTotal() MyClient = Client(); MyClient.Connect('localhost'); MyClient.GetFrame(); Output = MyClient.GetLatencyTotal();</pre>		
.NET	<pre>// class Output_GetLatencyTotal // { // public Result Result; // public double Total; // }; // // Output_GetLatencyTotal GetLatencyTotal(); ViconDataStreamSDK.DotNET.Client MyClient =</pre>			

SDK Functions Listing: GetLatencySampleCount

Appendix A: What's New

GetLatencySampleCount

Return the number of latency measurements that were taken at various stages of the real-time pipeline. This value can be passed into GetLatencySampleName().

 $\textit{See also:} \ \mathsf{GetFrame,} \ \mathsf{GetTimecode,} \ \mathsf{GetLatencyTotal,} \ \mathsf{GetLatencySampleName,} \ \mathsf{GetLatencySampleValue}$

Input				
Output	Result	Result	Result.Success Result.NotConnected Result.NoFrame	
	Count	unsigned int	The number of samples taken.	
C++	<pre>// class Output_GetLatencySampleCount // { // public: // Result::Enum Result; // unsigned int Count; // }; // // Output_GetLatencySampleCount GetLatencySampleCount() const; ViconDataStreamSDK::CPP::Client MyClient; MyClient.Connect("localhost"); MyClient.GetFrame(); Output GetLatencySampleCount Output = MyClient.GetLatencySampleCount();</pre>			
MATLAB	<pre>% [Output] = GetLatencySampleCount() MyClient = Client(); MyClient.Connect('localhost'); MyClient.GetFrame(); Output = MyClient.GetLatencySampleCount();</pre>			
.NET	<pre>// class Output_GetLatencySampleCount // {</pre>			

SDK Functions Listing: GetLatencySampleName

Appendix A: What's New

GetLatencySampleName

```
Return the name of a latency sample. This value can be passed into GetLatencySampleValue().
See also: GetFrame, GetTimecode, GetLatencyTotal, GetLatencySampleCount, GetLatencySampleValue
                                      Unsigned int
                                                      The index of the name.
Input
              LatencySampleIndex
                                                       Result.Success
Output
              Result
                                      Result
                                                      Result. Not Connected
                                                      Result.NoFrame
                                                      Result.InvalidIndex
              Name

```

SDK Functions Listing: GetSegmentParentName

Appendix A: What's New

GetSegmentParentName

Return the name of the parent segment for a specified subject segment. If the specified segment is the root segment of the subject then it will return an empty string.

See also: GetSegmentCount, GetSegmentChildCount, GetSegmentChildName, GetSubjectRootSegmentName

Input	Subject Name	string	The name of the subject	
	Segment Name	string	The name of the segment	
Output	Result	Result	Result.Success Result.NotConnected Result.NoFrame Result.InvalidSubjectName Result.InvalidSegmentName	
	Segment Name	string	The name of the parent segment or an empty string if it is the root segment.	
C++	<pre>// { // public: // Result::Enum // String // }; // // Output_GetSegment // // ViconDataStreamSD MyClient.Connect(MyClient.EnableSee MyClient.GetFrame Output_GetSegment Output = MyClient</pre>	<pre>// public: // Result::Enum Result; // String SegmentName; // }; // // Output_GetSegmentParentName GetSegmentParentName(// const String & SubjectName,</pre>		
MATLAB	<pre>% [Output] = GetSegmentParentName(SubjectName, SegmentName) MyClient = Client(); MyClient.Connect("localhost"); MyClient.EnableSegmentData(); MyClient.GetFrame(); Output = MyClient.GetSegmentParentName("Bob", "Pelvis"); % Output.Result == Success % Output.SegmentCount == "" % This is the root segment Output = MyClient.GetSegmentParentName("Bob", "LFemur"); % Output.Result == Success % Output.SegmentCount == "Pelvis"</pre>			
.NET	<pre>// { // public Resul- // public string // }; //</pre>	<pre>public Result; public string SegmentName; };</pre>		

SDK Functions Listing: GetSegmentParentName

SDK Functions Listing: GetSegmentChildCount

Appendix A: What's New

GetSegmentChildCount

Return the number of descendant segments for a specified subject segment in the DataStream. This information can be used in conjunction with GetSegmentChildName.

See also: GetSegmentChildName, GetSegmentParentName

See also: GetSeg	gmentChildName, GetSegr	mentParentName		
Input	Subject Name	string	The name of the subject	
	Segment Name	string	The name of the segment	
Output	Result	Result	Result.Success Result.NotConnected Result.NoFrame Result.InvalidSubjectName Result.InvalidSegmentName	
	Segment Count	unsigned integer	The number of segments

About the SDK	SDK Functions Listing: GetSegmentChildCount	Appendix A: What's New
	// Out	put.SegmentCount >= 0

SDK Functions Listing: GetSegmentChildName

Appendix A: What's New

GetSegmentChildName

```
Return the name of a child segment for a specified subject segment. This can be passed into segment functions.
See also: GetSegmentCount
                                    string
Input
                Subject Name
                                                                     The name of the subject

SDK Functions Listing: GetSegmentStaticRotationHelical

Appendix A: What's New

GetSegmentStaticRotationHelical

Return the static pose rotation of a subject segment in helical co-ordinates.

The helical co-ordinates represent a vector whose length is the amount of rotation in radians, and the direction is the axis about which to rotate.

See also: GetSegmentStaticTranslation, GetSegmentStaticRotationMatrix, GetSegmentStaticRotationQuaternion, GetSegmentStaticRotationEulerXYZ, GetSegmentLocalTranslation, GetSegmentLocalRotationHelical, GetSegmentLocalRotationMatrix, GetSegmentLocalRotationQuaternion, GetSegmentLocalRotationEulerXYZ

SDK Functions Listing: GetSegmentStaticRotationQuaternion

Appendix A: What's New

${\tt GetSegmentStaticRotationQuaternion}$

Return the static pose rotation of a subject segment in quaternion co-ordinates.

The quaterion is of the form (x, y, z, w) where w is the real component and x, y & z are the imaginary components. N.B. This is different from that used in many other applications, which use (w, x, y, z).

 $See\ also: \ Get Segment Static Translation, \ Get Segment Static Rotation Helical, \ Get Segment Static Rotation Matrix, \ Get Segment Static Rotation Euler XYZ, \ Get Segment Local Translation, \ Get Segment Local Rotation Helical, \ Get Segment Local Rotation Matrix, \ Get Segment Local Rotation Quaternion, \ Get Segment Local Rotation Euler XYZ$

SDK Functions Listing: GetSegmentGlobalTranslation

Appendix A: What's New

${\sf GetSegmentGlobalTranslation}$

Return the translation of a subject segment in global co-ordinates.

The Translation is of the form (x, y, z) where x, y & z are in millimeters with respect to the global origin.

 $See\ also: \ Get Segment Global Rotation Helical,\ Get Segment Global Rotation Matrix,\ Get Segment Global Rotation Quaternion,\ Get Segment Global Rotation Euler XYZ,\ Get Segment Local Rotation Helical,\ Get Segment Local Rotation Matrix,\ Get Segment Local Rotation Quaternion,\ Get Segment Local Rotation Euler XYZ$

```

SDK Functions Listing: GetDeviceOutputValue

Appendix A: What's New

GetDeviceOutputValue

Return the value of a device output. If there are multiple samples for a frame, then the first sample is returned.

The force plate data provided in the individual device channels is in a coordinate system local to the plate aligned Z upwards, Y towards the front of the plate. This coordinate system is located at the center of the top surface of the plate. Any plate origin offset has been accounted for in the moment data. These are forces not reactions.

SDK Functions Listing: GetGlobalForceVector

Appendix A: What's New

GetGlobalForceVector

Return the force vector for the plate in global co-ordinates.

The vector is in Newtons and is with respect to the global coordinate system regardless of the orientation of the plate. The vector represents the force exerted upon the plate, not the reaction force.

If multiple sub-samples are available this function returns the first subsample. See the alternate version of this function to access all of the analog data.

See also: GetGlobalMomentVector, GetGlobalCentreOfPressure

Input	Force Plate Index	unsigned integer	The index of the plate		
Output	Result	Result	Result.Success Result.NotConnected Result.NoFrame Result.InvalidIndex		
	ForceVector	double[3]	The force on the plate

SDK Functions Listing: GetGlobalForceVector

Appendix A: What's New

Output_ GetGlobalForceVector Output = MyClient. GetGlobalForceVector(0);

SDK Functions Listing: GetGlobalMomentVector

Appendix A: What's New

GetGlobalMomentVector

Return the moment vector for the plate in global co-ordinates.

The vector is in Newton-Meters and is with respect to the global coordinate system regardless of the orientation of the plate.

The vector represents the moment exerted upon the plate, not the reaction moment. Any force plate origin offset is accounted for in the moments so they are acting about the exact centre of the top surface of the plate.

If multiple sub-samples are available this function returns the first subsample. See the alternate version of this function to access all of the analog data.

See also: GetGlobalForceVector, GetGlobalCentreOfPressure

```

SDK Functions Listing: GetGlobalCentreOfPressure

Appendix A: What's New

GetGlobalCentreOfPressure

Return the centre of pressure for the plate in global co-ordinates.

The position is in millimeters and is with respect to the global coordinate system.

If multiple sub-samples are available this function returns the first subsample. See the alternate version of this function to access all of the analog data.

See also: GetGlobalForceVector, GetGlobalMomentVector

// Output.EyeTrackerCount >= 0
```

SDK Functions Listing: GetEyeTrackerGlobalPosition

Appendix A: What's New

${\sf GetEyeTrackerGlobalPosition}$

Returns the location of the eye. The position is in Millimeters with respect to the global origin. The segment and device data need to be enabled to get the position.

 $\textit{See also:} \ \mathsf{GetEyeTrackerCount}, \ \mathsf{GetEyeTrackerGlobalGazeVector}$

Input	EyeTrackerIndex	unsigned integer	The index of the eye tracker	
Output	Result	Result	Result.Success Result.NotConnected Result.NoFrame Result.InvalidIndex	
	Position	double[3]	The eye position	
	Occluded	boolean	This is true if the segment that has the eye tracker attached is not visible. If true the position will be (0,0,0).	
C++	// class Output_ // { // public: // Result::Enu // double // bool // }; // Output_GetEye // const unsigned in ViconDataStreamSD MyClient.Connect(MyClient.EnableS MyClient.EnableS MyClient.GetFrame Output_GetEyeTrace	<pre>// { // public: // Result::Enum Result; // double Position[3]; // bool Occluded; // }; // Output_GetEyeTrackerGlobalPosition GetEyeTrackerGlobalPosition(</pre>

SDK Functions Listing: GetEyeTrackerGlobalPosition

```
ViconDataStreamSDK.DotNET.Client MyClient = new
ViconDataStreamSDK.DotNET.Client();
MyClient.Connect( "localhost" );
MyClient. EnableSegmentData ();
MyClient. EnableDeviceData ();
MyClient. EnableDeviceData ();
MyClient.GetFrame();

Output_GetEyeTrackerGlobalPosition Output =
MyClient.GetEyeTrackerGlobalPosition ( 0 );
```

SDK Functions Listing: GetEyeTrackerGlobalGazeVector

Appendix A: What's New

${\sf GetEyeTrackerGlobalGazeVector}$

Returns the gaze direction as a unit vector in global coordinates. The gaze vector will be marked as occluded if the segment that has the eye tracker attached is not visible, the eye tracker is not calibrated or the pupil is not found. The segment and device data need to be enabled to get the gaze vector.

Output_GetEyeTrackerGlobalPosition Output =
MyClient.GetEyeTrackerGlobalPosition ( 0 );
```

SDK Functions Listing

Appendix A: What's New

Appendix A – What's New

What's New in Version 1.0

- Full access to analog device data in Nexus. This can be scaled data or raw voltages.
- One SDK for all applications.
- Four segment rotation options: Quaternion, 3x3 row-major Matrix, Helical, and EulerXYZ.
- Support streaming, request, and pre-fetch modes.
- Formats specific to C++, MATLAB and .NET.
- Version control.
- Result feedback for success criteria.

What's New in Version 1.0.1

- C++ programs that access the DS-SDK dll files can now be complied in Debug mode.
- New function calls for Vicon Tracker ***
 - ConnectToMulticast
 - StartTransmittingMulticast
 - $\ \mathsf{StopTransmittingMulticast}$
 - GetLatencyTotal
 - GetLatencySampleCount
 - GetLatencySampleName
 - GetLatencySampleValue

What's New in Version 1.1.0

- Release of C++ and .NET SDKs on Windows x64.
- Release of C++ SDK on Linux x86.
- New function calls
 - DisableSegmentData
 - DisableMarkerData
 - DisableUnlabeledMarkerData
 - DisableDeviceData
 - GetMarkerParentName
 - GetSubjectRootSegmentName
 - GetSegmentParentName
 - GetSegmentChildCount
 - GetSegmentChildName
 - GetSegmentStaticTranslation

^{***} These functions will not work with Vicon Nexus 1.4 and Vicon Blade 1.6.

SDK Functions Listing

Appendix A: What's New

- GetSegmentStaticRotationHelical
- GetSegmentStaticRotationMatrix
- GetSegmentStaticRotationQuaternion
- GetSegmentStaticRotationEulerXYZ
- Corrected some units. The values given by the SDK have not changed they were incorrectly labeled in previous versions.
 - "NewtonMillimetre" has become "NewtonMeter"
 - "Millimetre" has become "Meter"
- Corrected segment rotations following calls to SetAxisMapping()
- Added command-line options for the Test programs to specify a host to connect to.

What's New in Version 1.2.0

- Added C++ Linux x64 support
- Fix to support of .NET under Windows x64
- New function calls:
 - GetForcePlateCount
 - GetGlobalForceVector
 - GetGlobalMomentVector
 - GetGlobalCentreOfPressure
- Minor improvements to documentation.

What's New in Version 1.3.0

- New function calls:
 - GetFrameRate
 - GetEyeTrackerCount
 - GetEyeTrackerGlobalPosition
 - GetEyeTrackerGlobalGazeVector
 - GetDeviceOutputSubsamples
 - GetForcePlateSubsamples
- New overrides to function calls to allow access to all the analog data:
 - GetDeviceOutputValue
 - GetGlobalForceVector
 - GetGlobalMomentVector
 - GetGlobalCentreOfPressure
- Minor improvements to documentation.
- Added Mac OSX support.
